

Sprint 3 Plan - ArrowBerry

5/6/2026 - 5/18/2026

Goal: Start implementing quality of life features that would make the app more desirable for a user, as the MVP has been completed.

[user story 1] As an active user, I want to be able to rate each recipe so that the algorithm can be more catered towards what I like

[task 1] Create rating/review system to store how gauge how much a user liked each dish

[task 2] Optimize algorithm with user feedback (display recipes a person is more likely to enjoy based on their feedback)

[task 3] Add review text section to recipes

[task 4] Add 'my reviews' section to profile page

Total Time: 6 Story Points

[user story 2] As a forgetful person, I want a shopping list feature so that I can remember what I need to buy at the store

[task 1] Create shopping list popup on pantry page

[task 2] Implement list features add, remove, edit, clear, and a strikethrough option

[Task 3] Add 'add missing ingredients to shopping list' button on recipes

Total Time: 5 Story Points

[user story 3] As an environmentalist, I want the app to prioritize recommendations with food that may expire soon, so that I can reduce my waste

[task 1] Reconfigure scraper to gather information about food expiratory periods

[task 2] Populate that data into the food info database

[task 3] Create a function to estimate how long the user has till food spoils.

[task 4] Reconfigure recommendation algorithm to have a priority system

Story Points: 5 Story Points

~~[user story 4] As a health cognizant person, I want to see the nutritional summary for each recipe~~

~~—— [task 1] Redefine scraper to grab nutritional info from recipes (if there is any)~~

~~—— [task 2] Create a function to gather basic nutritional information for a list of ingredients, apply that on the most used ingredients.~~

~~—— [task 3] Create function to roughly estimate nutritional info about recipes with missing data~~

~~—— [task 4] Populate missing data rows with best estimates~~

~~Story Points: 8 Story Points~~

[user story 5] As an active user, I want the camera page to be prettier and easier to use so that I can more easily take pictures of my receipts and have the text extracted.

[Task 1] Refactor how the camera looks to make it take entire page as opposed to small section of the page

[Task 2] Remove unnecessary buttons such that the only buttons are take photo, upload photo, and retake photo

[Task 3] Adjust the reasoning model such that it will also estimate the expiry date on each receipt item

[Task 4] Give user option to remove or edit specific items that are extracted from the receipt before items are actually added.

Story Points: 5 points

[User story 6] As a user with allergies, I want to have the option/filter to avoid recipes that might be allergic to me.

[Task 1] Create section in profile to allergy/dietary preferences

[Task 2] Edit algorithm such that with a filter selected, you will not see recipes that fall under the selected category

Story Points: 4 Points

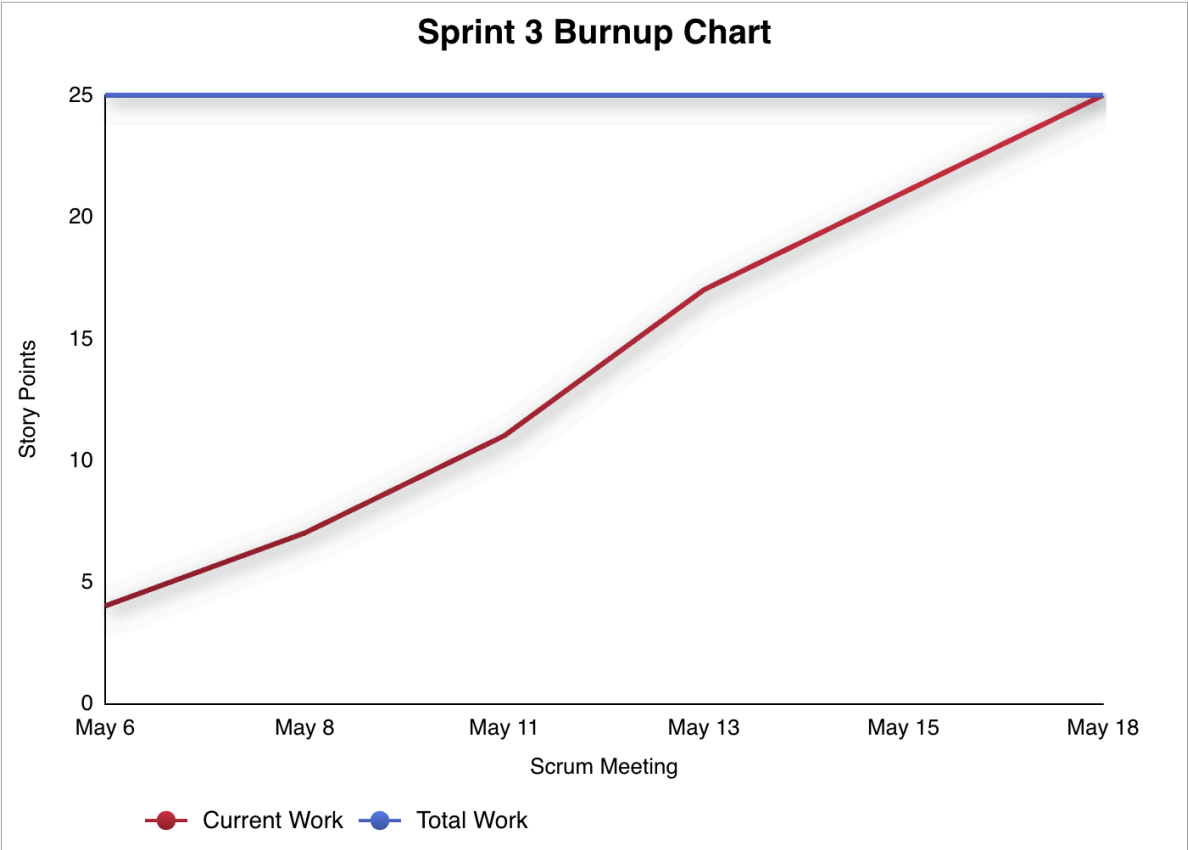

Team Roles

- Serves: Product Owner
- Nikhil: Team Member
- David: Team Member
- Akhilesh: SCRUM master

Initial task assignment:

- Serves: Camera Upgrade
- David: Shopping List
- Akhilesh: Rating System
- Nikhil: Expiratory Prioritization

Burn Up Chart

Scrum Board

USER STORY	TO DO	WORKING	DONE
Review System	•	• Optimize algorithm with user feedback (display recipes a person is more likely to enjoy based on their feedback)	- Create rating/review system to store how gauge how much a user liked each dish - Add 'my reviews' section to profile page - Add review text section to recipes
Shopping List	•	-	- Create shopping list popup on pantry page - Implement list features add, remove, edit, clear, and a strikethrough option - Add 'add missing ingredients to shopping list' button on recipes -
Expiratory Prioritization		-	- Reconfigure scraper to gather information about food expiratory periods - Populate that data into the food info database - Create function that estimates based off purchase date how long you have until food goes bad - Reconfigure recommendation

			algorithm to have a priority system
Health Summary	Redefine scraper to grab nutritional info from recipes (if there is any) Create a function to gather basic nutritional information for a list of ingredients, apply that on the most used ingredients. Create function to roughly estimate nutritional info about recipes with missing data Populate missing data rows with best estimates		
Camera Upgrade			-Refactor camera to be more visually appealing - Remove unnecessary buttons - Adjust model to estimate expiry dates -Let users update and delete extracted items before adding to pantry
